Burner Management System

L MV37.4...

Burner control with integrated air / fuel ratio control for forced draft burners.
The L MV37.4... are designed for intermittent operation with ionization probe or with optical detector QRA..., QRB... or QRC...
Continuous operation is possible only when using an ionization probe.

The L MV37.4... and this Data Sheet are intended for use by OEMs which integrate the burner management system in their products!

Use

The L MV37.4... burner management system is a microprocessor-based unit with matching system components for the control and supervision of forced draft burners of medium to high capacity.

Warning notes

For additional safety notes, refer to the Basic Documentation of the LMV37.4... system (P7546)!

To avoid injury to persons, damage to property or the environment, the following warning notes must be observed!

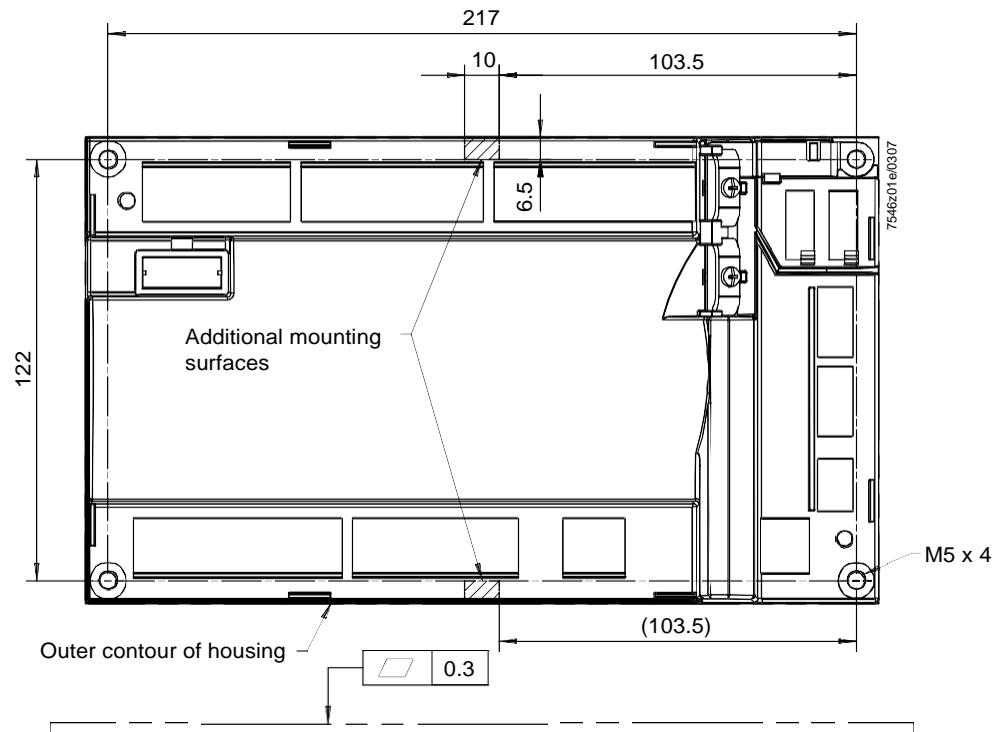

The LMV37.4... is a safety device! Do not open, interfere with or modify the unit. Siemens will not assume responsibility for any damage resulting from unauthorized interference!

- All activities (mounting, installation and service work, etc.) must be performed by qualified staff
- Before making any wiring changes in the connection area, completely isolate the plant from mains supply (all-polar disconnection). Ensure that the plant cannot be inadvertently switched on again and that it is indeed dead. If not observed, there is a risk of electric shock hazard
- Ensure protection against electric shock hazard by providing adequate protection for the burner control's connection terminals
- Each time work has been carried out (mounting, installation, service work, etc.), check to ensure that wiring and parameters is in an orderly state
- Fall or shock can adversely affect the safety functions. Such units must not be put into operation, even if they do not exhibit any damage

Mounting notes

Ensure that the relevant national safety regulations are complied with

Installation notes

- Always run high-voltage ignition cables separately while observing the greatest possible distance to the unit and to other cables
- Do not mix up live and neutral conductors (fire hazard, dangerous failures, loss of protection against electric shock hazard, etc.)
- Do not lay the connecting cable from the LMV37.4... to the AZL2... together with other cables

Electrical connection of the flame detectors

It is important to achieve practically disturbance- and loss-free signal transmission:

- Never run the detector cable together with other cables
 - Line capacitance reduces the magnitude of the flame signal
 - Use a separate cable
- Observe the maximum permissible detector cable lengths
- The ionization probe is not protected against electric shock hazard. It is mains-powered and must be protected against accidental contact
- Locate the ignition electrode and the ionization probe such that the ignition spark cannot arc over to the ionization probe (risk of electrical overloads)

Commissioning notes

- For display of the flame on the AZL2..., following general conditions apply:
 - Display is subject to various component tolerances so that deviations of $\pm 10\%$ can occur
 - Note that for physical reasons there is no linear relationship between flame display and detector signal values

Standards and certificates

Conformity to EEC directives

- Electromagnetic compatibility EMC (immunity)
- Directive for gas appliances
- Low-voltage directive

Life cycle

Burner controls has a designed lifetime* of 250,000 burner startup cycles which, under normal operating conditions in heating mode, correspond to 10 years of usage (starting from the production date given on the type field). This lifetime is based on the endurance tests specified in standard EN298 and the table containing the relevant test documentation as published by the European Association of Component Manufacturers (Afecor) (www.afecor.org).

The designed lifetime is based on use of the burner controls according to the manufacturer's Data Sheet and Basic Documentation. After reaching the designed lifetime in terms of the number of burner startup cycles, or the respective time of usage, the burner control is to be replaced by authorized personnel.

* The designed lifetime is not the warranty time specified in the Terms of Delivery.

Disposal notes

The unit contains electrical and electronic components and must not be disposed of together with domestic waste. Local and currently valid legislation must be observed.

Mechanical design

The LMV37.4... is a microprocessor-based system with matching system components for the control and supervision of forced draft burners of medium to high capacity.

The following system components are integrated in the LMV37.4... basic unit:

- Burner control with gas valve proving system
- Electronic air / fuel ratio control with a maximum of 2 actuators SQM3... or SQN1...
- Control frequency converter air fan
- Modbus interface

Example: Modulating gas burner

The system components (display and operating unit, actuators) are connected directly to the LMV37.4... basic unit. All safety-related digital inputs and outputs of the system are monitored by a contact feedback network (CFN).

For Europe

For intermittent operation in connection with the LMV37.4..., an ionization probe or optical flame detector type QRA..., QRB... or QRC... is used. **Continuous operation is possible only when using an ionization probe.**

For North America

For intermittent operation in connection with the LMV37.4..., an ionization probe or optical flame detector type QRA4... is used. **Continuous operation is possible only when using an ionization probe.**

General

The burner management system is operated and parameterized with the help of the AZL2... display and operating unit or a PC tool. The AZL2... features an LCD and menu-driven operation, offering straightforward operation and targeted diagnostics. To simplify diagnostics, the display shows the operating states, the type of fault and the point in time the fault occurred. The different parameter setting levels for the burner / boiler manufacturer and the heating engineer are protected by passwords. There is also a communication interface COM from which higher level systems such as building automation (BA). Using the BCI and OCI410... interfaces, a PC with ACS410 software can be connected. Among other features, the software affords convenient readout of settings and operating states, parameterization of the LMV37.4..., and trend logging. The burner / boiler manufacturer can choose from a number of different fuel trains and has a wide variety of parameter setting choices (program times, configuration of inputs and outputs, etc.) to ensure optimum adaptation to the relevant application. The actuators are driven by stepper motors and offer high-resolution positioning. The characteristics and settings of the actuators are defined by the LMV37.4... basic unit.

Condensation, formation of ice and ingress of water are not permitted!

**Technical data (cont'd)****Flame detectors****Ionization probe****For continuous operation!**

No-load voltage at ION terminal (X10-05 terminal 2)	Approx. UNetz
--	---------------

**Caution!****Protect the ionization probe against electric shock hazard!**

Short-circuit current	Max. AC 1 mA
Required detector current	Min. DC 4 µA, flame display approx. 30 %
Possible detector current	Max. DC 16...40 µA, flame display approx. 100 %
Max. perm. length of detector cable (laid separately)	3 m (wire – ground 100 pF/m)

Note:

With increasing detector cable capacitance (cable length), the voltage at the ionization probe, and thus the current, drops. Long cable lengths plus very highly resistive flames might necessitate low-capacitance detector cables (e.g. ignition cable). In spite of technical measures taken in the circuitry aimed at compensating potential adverse effects of the ignition spark on the ionization current, it must be made certain that the minimum detector current required will already be reached during the ignition phase. If this is not the case, the connections on the primary side of the ignition transformer must be changed and / or the electrodes relocated.

**Photoresistive
detectors QRB...**

No-load voltage at QRB... terminal (X10-05 terminal 3)	Approx. DC 5 V
Max. perm. length of QRB... detector cable (laid separately)	3 m (wire – wire 100 pF/m)

Note:

A detector resistance of $RF < 500 \text{ }\text{k}\Omega$ is identified as a short-circuit and leads to shutdown in operation as if the flame had been lost.

For this reason, before considering the use of a highly sensitive photoresistive detector (QRB1B... or QRB3S), it should be checked whether this type of flame detector is really required! Increased line capacitance between QRB... connection and mains live wire L has an adverse effect on sensitivity and increases the risk of damaged flame detectors due to overvoltage. Always run detector cables separately!

Threshold value flame supervision QRB... with LMV37.4...

Start prevention (extraneous light) with RQRB	<400 k Ω Intensity >10 %
Operation with RQRB	<230 k Ω Intensity >16 %
Short-circuit detection with RQRB	<0.5 k Ω

Flame detectors**QRA2... / QRA4... (US)
/ QRA10...****Caution!**

If flame detectors type QRA2... / QRA4... (US) / QRA10... are used for flame supervision with the LMV37.4..., it must be ensured that the detector is permanently connected to power (conforming to EN230), thus enabling the system to detect flame detector failures during startup.

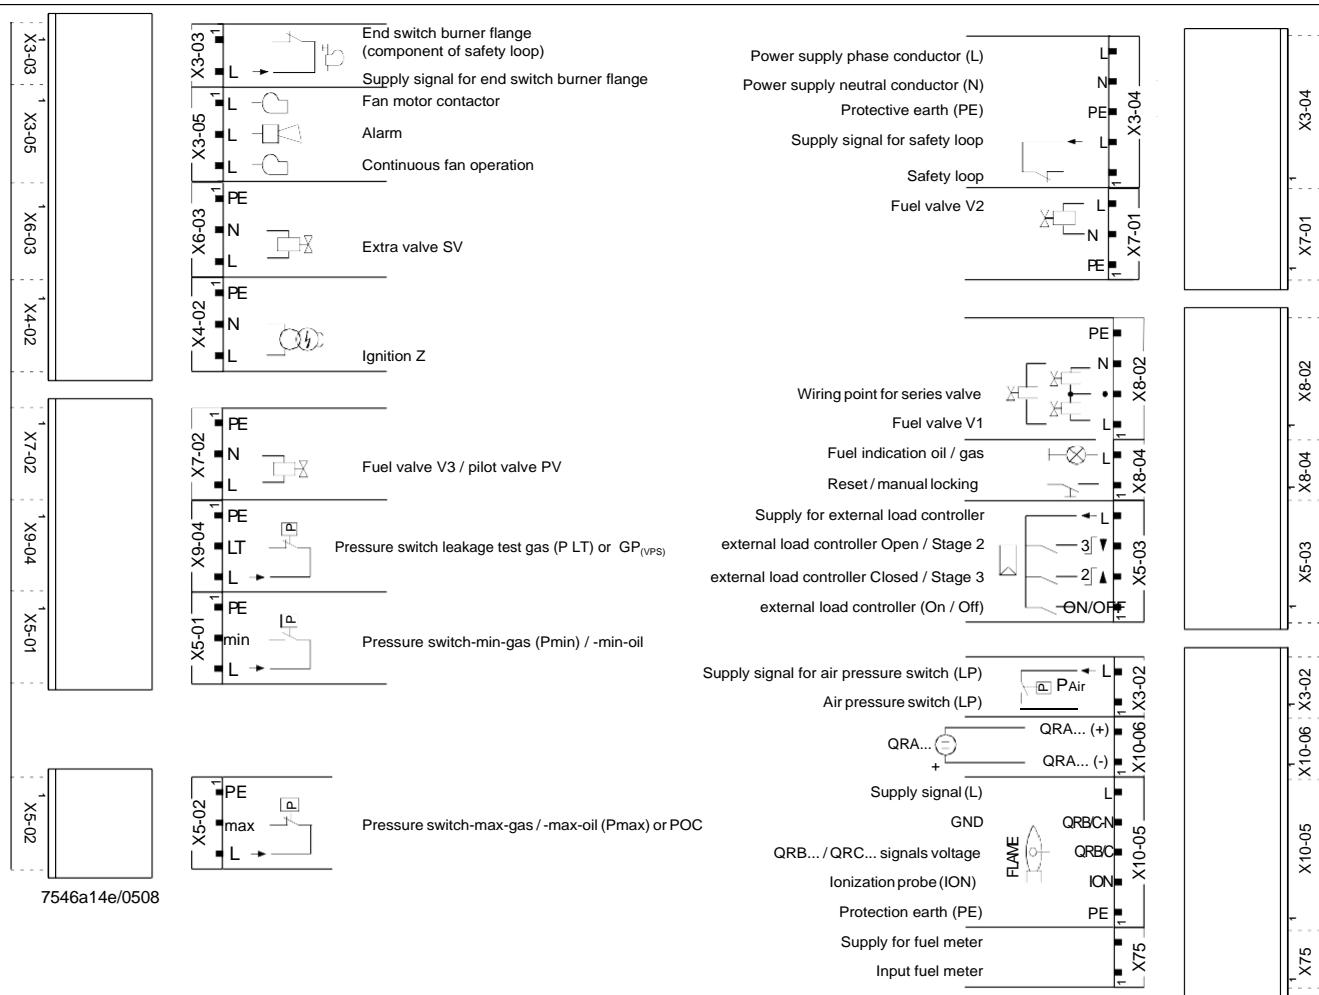

**Blue-flame detectors
QRC...**

Check the flame intensity via AZL2...

For system specific reasons, the display by AZL2... of maximum intensity is limited to approx. 55 %.

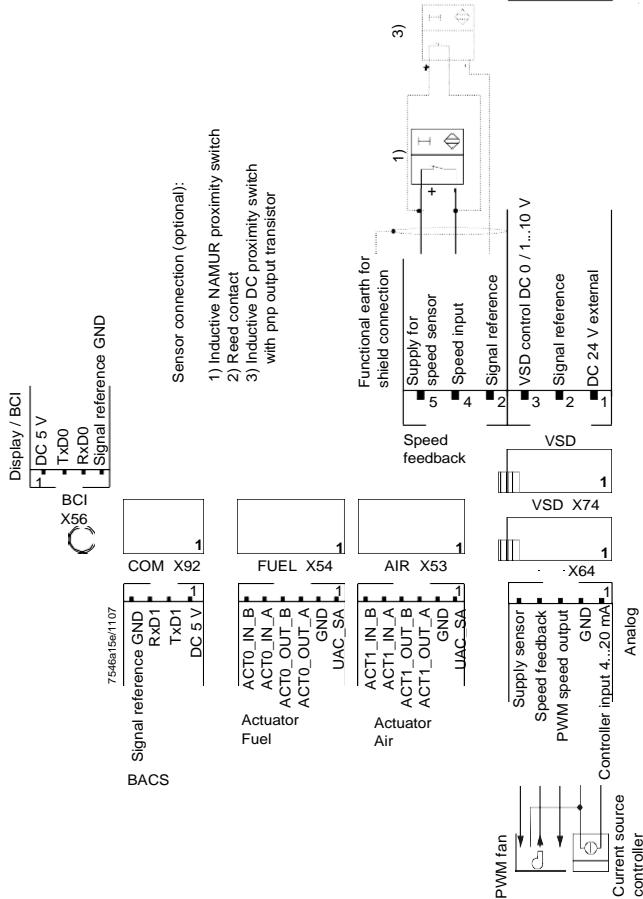

Inputs / outputs
